IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Applicant: Kazuo OKADA

No. 10/697080 ~

Filed: October 31,2003 / For GAMING MACHINE

DECLARATION AND VERIFIED TRANSLATION

Hon. Commissioner of Patents

and Trademarks

Washington, D.C. 20231

Sir:

I, Shiro TERASAKI, a Japanese Patent Attorney registered No. 9265 having my business office at Ginza First Bldg., 10-6, Ginza 1-chome, Chuo-ku, Tokyo 104-0061 Japan, hereby declare and say:

that I am thoroughly conversant with both the Japanese and English languages; and, that the attached document represents a true English translation of United States Patent Application as filed in accordance with 37 CFR Section 1.52(d) in the Japanese language on October 31,2003 which is claimed and for which a patent is sought on the invention entitled: GAMING MACHINE

I further declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

Signed this _	22nd	day of	March	, 2004

TITLE OF THE INVENTION

GAMING MACHINE

5

10

15

20

25

Field of Technology

[0001] This invention relates to a gaming machine comprising a transparent electric display panel disposed in front of variable display means for variably displaying designs.

Description of Related Art

[0002] Conventionally, this type of gaming machine includes, for example, a slot machine. The slot machine comprises three reels embedded behind its front panel. Each reel comprises a reel band affixed on the outer periphery of its reel drum, and various designs are drawn on the outer periphery of the reel band. These designs may be viewed by a player through three windows formed in the front panel.

[0003] A slot machine game is started when the player's operation of a start lever causes each reel to rotate and a moving sequence of designs is variably displayed in each window. Subsequently, the player's operation of a stop button causes each reel to stop rotating, and designs corresponding to the operation timing of the stop button are stop-displayed in each window. At this time, if any predetermined combination of

designs is stop-displayed in the windows, a winning occurs.

[0004] During the game, the slot machine game provides effects such as blinking lamps embedded in each reel or displaying character designs on a liquid crystal display device provided below the windows of the front panel.

Summary of the Invention

5

10

15

2.0

25

conventional gaming machines Ιn [0005] described above, the novelty of game effects is maintained by changing the blinking pattern of the lamps embedded in the reels, changing effect contents given by character designs displayed on the liquid crystal display device, or otherwise. However, in the conventional gaming machines described above, the machine components of the gaming machine for effecting game effects have Accordingly, there are been well-established. some difficulties in maintaining the novelty of game effects.

[0006] To solve these problems, this invention provides a gaming machine comprising: variable display means for variably displaying designs; a transparent liquid crystal display panel disposed in front of the variable display means through which the variable display means is

able to be seen; a liquid crystal holder for holding the periphery of the display unit of the liquid crystal display panel; a light guiding plate for guiding light emitted from a light source to the rear side of the liquid crystal display panel; diffusion means for diffusing the light guided by the light guiding plate to equalize the light which illuminates the liquid black base display panel; crystal а attached in front of the machine for supporting the liquid crystal holder, light guiding plate and diffusion means such that the front of the display unit of the liquid crystal display panel has an opening; a transparent plate disposed in front of the base frame for closing the opening; and a rear holder for holding the liquid crystal holder, light guiding plate and diffusion means supported by the base frame on the base frame from behind, and for reflecting the light emitted on the light guiding plate to the side of the liquid crystal display panel, the rear holder having one or more windows allowing the designs variably displayed in the variable display means to be observed.

5

10

15

20

25 [0007] According to this configuration, the liquid crystal display panel disposed in front of

the variable display means for variably displaying designs serves as a new machine component for performing game effects. Further, since the base frame located in front of the liquid crystal display panel is black-colored, any light incident on the base frame is not easy to be reflected on the liquid crystal display panel.

Detailed Description of the Invention

[0008] An embodiment will now be described in which a gaming machine in accordance with this invention is applied to a slot machine.

[0009] Fig. 1 is a front view showing an appearance of a slot machine 1 in accordance with this embodiment.

[0010] Inside a cabinet at the center of the main body of the slot machine 1, three reels 2, 3, and 4 are rotatably provided. These reels 2, 3, and 4 constitute variable display means for

variably displaying various designs used for a in a plurality of rows. On the outer periphery of each reel 2, 3, 4, a plurality of kinds of designs (hereinafter referred to as symbols) are drawn to form a symbol sequence. A reel display window unit 39 is provided in front of these reels 2-4. Through display windows 5, 6, and 7 formed in the reel display window unit 39, symbols drawn on the reels 2, 3, and 4 are observed, three symbols for each reel. A total of five pay lines are provided on the reel display window unit 39 where three of them are horizontal and two diagonal. Furthermore, below the display windows 5-7, on the right side, an insertion slot 8 is provided through which a player can insert one or more medals serving as gaming media.

5

10

15

20

25

[0011] When a player inserts one medal into the medal insertion slot 8 prior to starting a game, one horizontal center pay line L1 is activated as shown in Fig. 2(a). When two medals are inserted, two upper and lower horizontal pay lines L2A and L2B are added thereto, and thus three horizontal pay lines L1, L2A, and L2B are activated as shown in Fig. 2(b). Furthermore, when three medals are inserted, all the five pay

lines L1, L2A, L2B, L3A, and L3B are activated as shown in Fig. 2(c). A circle sign shown in Fig. 2 represents a symbol drawn on each reel 2-4.

5

10

15

20

25

On a machine front panel 38 to the [0012] left of the display windows 5-7, from the top, are four chance LEDs (light emitting game operation indicator 9-12, three diodes) lamps 13-15, a deposited number of game medals display unit 16, and a start lamp 17 provided. The chance LEDs 9-12 and the game operation indicator lamps 13-15 are controllably lighted up in accordance with the game status to inform a player of the current game status. The deposited number of game medals display unit 16 is composed seven-segment LEDs three digits of displays the number of medals currently credited The start lamp 17 is blinked within the machine. when each reel 2-4 can be actuated.

[0013] On the machine front panel 38 to the right of the display windows 5-7, from the top, there are a bonus count display unit 18, a WIN lamp 19, number of payout medals display unit 20, and an insert lamp 21 provided. The bonus count display unit 18 is composed of three digits of seven-segment LEDs and digitally displays, when a player wins a bonus game, the remaining number of

times the player could win the RB game and JAC game described below. The WIN lamp 19 is lighted up when a winning combination of symbols lines up on any activated pay line. The number of payout is composed of three medals display unit 20 seven-segment LEDs and displays the digits of number of medals paid out due to the winning. when lighted uр 21 is insert lamp insertion slot 8 can accept the insertion of medals.

5

10

15

20

25

39 unit display window reel The [0014] comprises a liquid crystal panel 39d (described stacked thereon as an electric display below) panel. The liquid crystal panel 39d may display various game information and game effect images. Below the left-hand machine front panel 38, there are a cross key 23, an A-button 24, a B-button 25, one-deposited-medal insertion switch 26, twodeposited-medal insertion switch 27, and threedeposited-medal insertion switch 28 provided. The cross key 23 is switched in four directions of up, down, left, and right, and is operated in conjunction with the A-button 24 and B-button 25 for use in selecting information to be displayed on the liquid crystal panel 39d. The depositedswitches 26-28 in are used medal insertion

betting one to three medals on one game instead of inserting medals into the medal insertion slot 8 when the deposited number of game medals display unit 16 is displaying the number of credited medals.

5

10

15

20

25

Below the reel display window unit 39, [0015] deposited-medal the left, there are a adjusting switch 29, a start lever 30, and stop buttons 31, 32, and 33 provided. The start lever 30 constitutes game starting means for starting a game. The deposited-medal adjusting switch 29 is used in adjusting the medals credited within the machine. Operation of the start lever 30 causes each reel 2-4 to start rotating simultaneously. The stop buttons 31-33, disposed corresponding to the reels 2-4, respectively, are activated for operation when the rotating of each reel 2 - 4reaches a predetermined speed, and stop the rotating of respective reels 2-4 in response to The stop buttons 31-33 the player's operation. constitute variable display stopping means for stopping the rotating display of the reels 2-4. A medal receiving tray 34 is provided at the front bottom of the slot machine 1. medal receiving tray 34 serves to store medals paid out of a medal payout opening 35. At the

front top of the slot machine 1, a payout display unit 36 is provided for displaying how many medals will be paid out for winning.

5

10

15

20

25

Fig. 3(a) is а vertical [0017] sectional view of the slot machine 1 at the reel display window unit 39, and Fig. 4 is an exploded perspective view of the reel display window unit The reel display window unit 39 constitutes front display means, and is provided in front of the reels 2, 3, and 4 as shown in Fig. 3(a). As shown in Figs. 4(a)-(i), the reel display window unit 39 comprises, disposed from the front side of the machine, a transparent acryl plate 39a, a reel glass base 39b, a bezel metal frame 39c, a liquid crystal panel 39d, a liquid crystal holder 39e, a diffusion sheet 39f, a light guiding plate 39g, a rear holder 39h, and an antistatic sheet The diffusion sheet 39f, light guiding plate 39g, and rear holder 39h are provided with 5c forming the display openings 5a, 5b, and window 5, openings 6a, 6b, and 6c forming the display window 6, and openings 7a, 7b, and 7c forming the display window 7.

[0018] The reel display window unit 39 is mounted on the machine front panel 38 such that, as shown in Fig. 3(a), brackets 39ba provided on

the reel glass base 39b and protruding upward and downward are screwed on the rear of the machine front panel 38 with screws 39j, respectively. in Fig. 4(b), each bracket Note that provided on the reel glass base 39b is not shown. At the upper and lower ends of the [0019] light guiding plate 39g, a pair of cold-cathode tubes 40a is provided as a light source for the Above and below each liquid crystal panel 39d. window 5c, 6c, 7c of the rear holder 39h on its rear side, another pair of cold-cathode tubes 40b is provided for illuminating symbols drawn on the outer periphery of each reel 2-4.

5

10

15

20

25

39d liquid crystal panel [0020] The transparent electric display panel disposed front of the reels 2-4 and made of ITO or the like through which each reel 2-4 can be seen. The rear side of the periphery of its display unit is held by the liquid crystal holder 39e. The light guiding plate 39g is made of a light transparent resin panel, and has a lens formed therein for guiding light emitted from the laterally disposed cold-cathode tubes 40a to the rear side of the liquid crystal display panel 39d. The diffusion sheet 39f is made of a light and constitutes transparent resin sheet,

diffusion means for equalizing the light which illuminates the liquid crystal display panel 39d. The liquid crystal holder 39e holding the liquid crystal display panel 39d, the diffusion sheet 39f, and the light guiding plate 39g are integrated and the periphery thereof is inserted into the bezel metal frame 39c. This insertion allows the front side of the periphery of the display unit of the liquid crystal panel 39d to be held by the bezel metal frame 39c.

÷,

5

10

15

20

[0021] The bezel metal frame 39c, into which the liquid crystal holder 39e, the diffusion sheet 39f, and the light guiding plate 39g are fitted and integrated, has its periphery inserted into the reel glass base 39b, and is supported by the reel glass base 39b such that the front of the display unit of the liquid crystal panel 39d has an opening. Since the reel glass base 39b is attached to the machine front panel 38 with the screws 39j, the transparent acryl plate 39a is pressure bonded to the front of the reel glass base 39b and occludes the above-described opening of the front of the display unit of the liquid crystal panel 39d.

25 [0022] The rear holder 39h is made of a white resin plate and holds, on the reel glass base 39b

from behind, the bezel metal frame 39c, the liquid crystal holder 39e holding the liquid crystal panel 39d, the diffusion sheet 39f, and the light guiding plate 39g, which are supported by the reel glass base 39b. The rear holder 39h also functions as a reflection plate for reflecting the light, emitted from the cold-cathode tubes 40a on the light guiding plate 39d, to the side of the liquid crystal panel 39d. The antistatic sheet 39i, being transparent, is adhered to the rear side of the rear holder 39h with double-sided tapes and covers the rear side of the openings 5c, 6c, and 7c formed in the rear holder 39h.

5

10

15

2.0

25

[0023] Fig. 3(b) is a partial enlarged view of a marginal portion of the opening 5c, 6c, 7c of the rear holder 39h, which is circumscribed by a dashed circle shown in Fig. 3(a). A marginal corner portion of the rear side of the opening 5c, 6c, 7c of the rear holder 39h has been chipped away. The antistatic sheet 39i is adhered to this chipped portion.

[0024] Fig. 5 shows symbol sequences drawn on the outer periphery of the reels 2, 3, and 4.

Each symbol sequence comprises 21 arranged symbols of a plurality of kinds. The symbol

sequences correspond to a first reel 2, a second reel 3, and a third reel 4, respectively, from the left in the figure. Each symbol is assigned a code number among "1" to "21". Each reel 2, 3, 4 is rotationally driven such that its symbol sequence moves downward in the figure.

5

10

15

20

25

[0025] There are seven kinds of symbols: "Red 7" representing a digit shaded with mesh lines; "Blue 7" representing a digit shaded with lines sloping down to the left; "BAR" including two lines of alphabetic letters BAR arranged vertically; "Watermelon" consisting of a picture of a watermelon; "Bell" consisting of a picture of a bell; "Plum" consisting of a picture of a plum; and "Cherry" consisting of a picture of cherries.

[0026] Each reel 2-4 is configured as a rotatable reel unit as shown in Fig. 6, and attached to a frame 41 via a bracket 42. Each reel 2-4 comprises a reel drum 43 having a reel band 44 affixed on its outer periphery. The symbol sequence described above is drawn on the outer periphery of the reel band 44. Each bracket 42 is provided with a stepping motor 45. The reels 2-4 rotate when the stepping motors 45 are driven.

[0027] Each reel 2-4 has a structure shown in Fig. 7(a). Note that in this figure, like parts as in Fig. 6 are marked with like reference letters and are not described herein. A lamp case 46 is provided inside the reel drum 43 behind the reel band 44. Back lamps 47a, 47b, and 47c are installed in three compartments of the lamp case 46, respectively. Each of these back lamps 47a-47c is made of a while LED (light emitting diode) having a great amount of light emission, mounted on a board 48 as shown in Fig. 7(b). The board 48 is in turn attached to the rear side of the lamp case 46. Furthermore, a photosensor 49 is attached to the bracket 42. The photosensor 49 detects a shield plate 50 provided on the reel drum 43 passing by the photosensor 49 in association with the rotating of the reel drum 43.

5

10

15

20

25

[0028] Each back lamp 47a-47c is controllably lighted up by the lamp drive circuit described below. Each of the lighted back lamps 47a-47c separately illuminates three symbols positioned in front of the back lamp 47 among the symbols drawn on the reel band 44, and the three symbols are projected on each display window 5-7. In this embodiment, since the back lamps 47a-47c

have a great amount of light emission, they also illuminate the liquid crystal panel 39d in front thereof. Furthermore, since the back lamps 47a-47c are made of white LEDs, the colors of the symbols drawn on the reel band 44 and of the effect displayed on the liquid crystal panel 39d are viewed in a manner faithful to the original colors.

a winning

symbol

5

10

15

20

25

Fig. 8 shows [0029] combination table, which has been predetermined in the slot machine 1 in accordance with this embodiment, and shown on the payout display unit 36 at the front top of the slot machine 1. In a ordinary game, if a combination of symbols "Red 7"-"Red 7"-"Red 7", a combination of symbols "Blue 7"-"Blue 7"-"Blue 7", or a combination of symbols "BAR"-"BAR"-"BAR" lines up on activated pay line, fifteen medals are paid out and then an RB (regular bonus) game is executed. Further, in a ordinary game, if three identical symbols of "Watermelon" or "Bell" line up on any activated pay line, a small prize is won, and fifteen medals are paid respectively. Similarly, in a ordinary game, if a combination of symbols "Bell"-"Bell"-"Red 7", a combination of symbols "Bell"-"Bell"-"Blue 7", or a combination of symbols "Bell"-"BAR" occurs, a small prize is also won, and ten medals are paid out, respectively.

[0031] Furthermore, in a ordinary game, if three identical "Plum" symbols occurs on any activated pay line, then a replay is won, and one can play another game without inserting any medal, although no medal is paid out. In addition, this combination of three "Plum" symbols is also a combination of a JAC game winning occurrence in a JAC game during an RB game. The JAC game refers to a game of trying to get a combination of "Plum"-"Plum" on the center pay line L1 in an RB game.

5

10

15

20

2.5

[0032] Moreover, in a ordinary game, if one symbol "Cherry" stops on one activated pay line for the first reel 3, a small prize is won and two medals are paid out, which is referred to as "two medals cherry". When three medals have been bet, if one symbol "Cherry" stops on two activated pay lines, four medals are paid out, which is referred to as "four medals cherry".

[0033] Figs. 9 and 10 show circuit configurations arranged on a main control board 61 and a sub-control board 62 for controlling the game processing operation of the slot machine 1

described above.

The main control board 61 shown in Fig. 9 has a control unit comprising a microcomputer 63 as its major component, and additionally a for sampling random numbers. The 5 circuit microcomputer 63 comprises a main CPU (central unit) 64 for performing control processing operations in accordance with a preset program, a program ROM (read only memory) 65 served as program storage means, and a backup-capable 10 control RAM (random access memory) 66. The CPU 64 has connected thereto a clock pulse generator 67 and a frequency divider 68 for generating reference clock pulses, a random number generator 15 69 for generating a certain range of random numbers, and a random number sampling circuit 70 specifying one of the generated random In addition, an I/O port 71 is also numbers. communicating signals connected for peripheral devices (actuators) described below. 20 The ROM 32 has a storage unit divided so as to store a winning probability table, a symbol table, winning symbol combination table, and sequence program.

25 [0035] Principal actuators whose operation is controlled by a control signal from the

microcomputer 30 include the stepping motors 45 for rotationally driving the respective reels 2, 3, and 4, various lamps (game operation indicator lamps 13-15, start lamp 17, and WIN lamp 19), various display units (deposited number of game medals display unit 16, chance LEDs 9-12, bonus count display unit 18, number of payout medals display unit 20), and a hopper 72 for containing medals. These are driven by a motor drive circuit 73, an individual lamp drive circuit 74, an individual display unit drive circuit 75, and a hopper drive circuit 76, respectively. These drive circuits 73-76 are connected to the CPU 64 via the I/O port 71 of the microcomputer 63.

5

10

15

20

25

[0036] Major input signal generation means for generating input signals required for the microcomputer 63 to produce control signals include an inserted medal sensor 8S for detecting any medal inserted through the medal insertion slot 8, a start switch 30S for detecting any lever 30, the aboveoperation of the start described deposited-medal insertion switches 25-27, and the deposited-medal adjusting switch 29. In addition, there is a reel position detecting circuit 77 for detecting the rotational position of each reel 2, 3, 4 upon receipt of an output

pulse signal from the photosensor 49. The photosensor 49 is included in the driving mechanism of each reel 2-4 and not shown in this figure.

5

10

15

20

25

The reel position detecting circuit 77 [0037] counts the number of driving pulses supplied to each stepping motor 45 after the reels 2-4 have started to rotate, and writes these count values in the RAM predetermined area Accordingly, the RAM 66 stores the count value corresponding to the rotational position within a range of one rotational cycle for each reel 2-4. On the other hand, the photosensor 49 detects the shield plate 50 for each rotational cycle of the reel 2-4 to generate a reset pulse. This reset pulse is applied to the CPU 63 via the reel position detecting circuit 77 and causes count value of driving pulses counted in the RAM 66 to be cleared to "0". This clear processing eliminates any deviation occurring between the moving display of each symbol and the rotation of each stepping motor 45 for one rotational cycle. signal generation means input [8800] The described above also includes a reel stop signal circuit 78 for generating a signal for stopping a corresponding reel when any stop button 31, 32,

is pushed, a medal detection unit 72S counting the number of medals paid out of hopper 72, and a payout complete generation circuit not shown. The payout complete signal generation circuit generates a signal indicating the completion of medal payout when the count value of medals actually paid out inputted from the medal detection unit reaches the payout amount data represented by the count signal inputted from the display unit drive Each circuit constituting these circuit 75. input signal generation means is also connected to the CPU 64 via the I/O port 71.

5

10

15

2.0

25

To the I/O port 71, a sub-control unit [0039] The is connected. communication port 79 microcomputer 63 delivers a signal to the sub-62 via the sub-control control board communication port 79. The sub-control board 62 shown in Fig. 10 is provided with a main control unit communication port 80 for receiving this signal. Communication between the sub-control unit communication port 79 and the main control unit communication port 80 is performed only in sub-control the direction from one communication port 79 to the main control unit communication port 80. In this embodiment, the

delivered from the sub-control signal communication port 79 to the main control unit communication port 80 is composed of a set of a command type representing its control type in 7length and a parameter representing the bit content of the command in 8-bit or 24-bit length. The sub-control board 62 has a control unit comprising a microcomputer 81 as its major additionally а circuit and component, sampling random numbers. The microcomputer 81 also comprises, as with the microcomputer 63 in the main control board 61, a sub-CPU 82 for performing control operations in accordance with a preset program, a program ROM 83 serving as program storage means, and a backup-capable The CPU 81 has also connected control RAM 84. thereto a clock pulse generator 85 for generating reference clock pulses and a frequency divider 86. In addition, an I/O port 87 is connected for communicating signals with the main control unit communication port 80 and the actuators described The sub-CPU 82 calculates data required below. to display gaming machine data on the liquid crystal panel 39d on the basis of the command transmitted from the main control board 61 for each game, and updates data stored in the control

5

10

15

20

25

RAM 84 to the data calculated for each game.

5

15

2.0

25

operation is Actuators whose a control signal from the controlled by microcomputer 81 include the reel back lamps 47a, 47b, and 47c embedded in the reels 2 - 4, respectively. The lighting of these reel back lamps 47a-47c is controlled by a driving signal from a lamp drive circuit 89 connected to the I/O In addition, input signal generation port 87. means for generating input signals required for the microcomputer 81 to produce control signals include the cross key 23, A-button 24, and Bbutton 25 described above. Furthermore, a game status monitoring timer 97 is connected to the I/O port 87. This timer 97 is set at the time of starting a game by the sub-CPU 82, and measures an elapsed time since the start of the game.

image control ΙC (integrated [0042] Αn circuit) 90 and a sound source IC 91 are also connected to the I/O 87. The image control IC 90has connected thereto a character ROM 92 for storing character data and a video RAM 93 serving as a memory for color display representation. The image control IC 90 displays an image on the liquid crystal panel 39d of the reel display window unit 39 under the control οf the

microcomputer 81. The microcomputer 81 fetches such information as the current game status and the type of winning flag from the main control board 61 via the main control unit communication port 80, and selects an image effect pattern to be displayed on the basis of the fetched game It then controls the status and winning flag. 90 for causing the liquid image control IC crystal panel 39d to display the selected pattern. The liquid crystal panel 39d may be caused to display information desired by a player through the operation of the cross key 23, A-button 24 and B-button 25.

5

10

15

20

25

The sound source IC 91 has connected thereto a sound ROM 94 for storing sound data. Under the control of the microcomputer 81, the sound source IC 91 causes a speaker 96 via a emit 95 а sound. power amplifier to accordance with the instructions inputted from the main control board 61 via the main control unit communication port 80, the microcomputer 81 source ΙC 91 and controls the sound power speaker 96 amplifier for causing the 95 produce such sound effects as a medal insertion lever operation sound, a sound, a start button operation sound, and a game sound during a

bonus game.

5

10

15

20

25

In the slot machine 1 in accordance with this embodiment having the configuration described above, when a player operates the start lever 30, this operation leads to a turn on of the start switch 30S. This ON signal is detected by the main CPU 64 via the I/O port 71. The main CPU 64 then controls the motor drive circuit 73 for driving the stepping motors 45, causing each reel 2-4 to rotate. At the same time as this rotating, the main CPU 64 performs probability lottery processing. By making reference to a lottery probability table deposited in program ROM 65, a lottery of the internal winning mode is drawn. The type of the drawn internal winning mode and the current game status transmitted to the sub-control board 62 via the sub-control unit communication port 79.

[0045] As each reel 2-4 rotates, a moving sequence of symbols is variably displayed in each window 5-7. The player tries to adjust the timing of operating each stop button 31-33 while observing this variable display, and performs a push operation of each stop button 31-33 at an appropriate timing. The operation of each stop button 31-33 is detected by the main CPU 64 via

the reel stop signal circuit 78. At the time of this detection, supply of driving pulses to each stepping motor 45 is stopped by the control of the main CPU 64. When the supply of driving pulses to each stepping motor 45 is stopped, each 2 - 4stops rotating, and reel corresponding to the operation timing of stop button 31-33 are stop-displayed in window 5-7. At this time, if any predetermined combination of symbols shown in the payout table is stop-displayed in the windows 5-7, a winning occurs. When a winning occurs, the main CPU 64 controls the hopper drive circuit 76 for driving the hopper 72, and a predetermined number of medals are paid out of the payout opening 35 into the receiving tray 34.

[0046] The type of internal winning mode and the game status transmitted from the sub-control unit communication port 79 to the sub-control board 62 is received by the sub-control board 62 via the main control unit communication port 80 of the sub-control board 62. During the slot machine game described above, effects of the slot machine game are performed under the control of the sub-CPU 82 which has detected the type of internal winning mode and the game status, such

as blinking reel back lamps 47a, 47b, and 47c embedded in the reels 2-4 or displaying character the liquid crystal display 39d designs on provided below the display windows 5-7 of the reel display window unit 39. Furthermore, embodiment, effects are displayed in this accordance with the type of internal winning mode and the game status also on the liquid crystal display 39d provided in reel display window unit 39 in front of the reels 2-4.

[0047] According to the slot machine 1 in accordance with this embodiment as described above, the liquid crystal panel 39d disposed in front of the reels 2-4 for variably displaying symbols serves as a new machine component for performing game effects. Therefore, new effects for the slot machine game can be performed on the liquid crystal panel 39d, which facilitates maintaining the novelty of effects for the slot machine game.

[0048] Furthermore, in the slot machine 1 in accordance with this embodiment, since the reel glass base 39b in front of the liquid crystal panel 39d is black-colored, light incident on the reel glass base 39b is hardly reflected in the liquid crystal panel 39d. Owing to this, since

no light incident on the reel glass base 39b is mirrored into the liquid crystal panel 39d, it is possible to maintain the visibility of the liquid crystal panel 39d and the reels 2-4 behind the same.

As described above, according to this [0049] invention, the liquid crystal display panel disposed in front of the variable display means for variably displaying designs serves as a new machine component for performing game effects. Further, since the base frame in front of the liquid crystal panel is black-colored, the light incident on the base frame is hardly reflected in the liquid crystal panel. Accordingly, new game effects can be performed on the liquid crystal display panel, which facilitates maintaining the novelty of game effects. Moreover, since no light incident on the base frame is mirrored into the liquid crystal panel, it is possible to maintain the visibility of the liquid crystal panel and the variable display means behind the same.

[0050] Although only some exemplary embodiments of this invention have been described in detail above, those skilled in the art will readily appreciate that many modifications are

possible in the exemplary embodiments without materially departing from the novel teachings and advantages of this invention. Accordingly, all such modifications are intended to be included within the scope of this invention.
